

Fig. S3. Impact of the ValRSC-ATP synthase interaction.

(A) Aminoacylation assays with cell fractions from wild-type cells and Δ^C cells. Values are the mean aminoacylation activity of three independent cultures and error bars correspond to the standard deviation. (B) ATP content of wild-type cells and Δ^C cells growing under standard conditions or after incubation with MSX for 4h as indicated. Values are the mean ATP concentration of three independent cultures and error bars correspond to the standard deviation.
